Midwifery Care on Toddlers with Under of Nutrition
+87 pages + 1 table

ABSTRACT

Malnutrition is a condition where the toddler's weight does not match with their age caused by insufficient nutrients consumption for a certain time. Nutritional status in the world including the prevalence of wasting (thin) 52 million children under five (8%). The prevalence of underweight in the world in 2016 is based on Africa 17.3% (11.3 million), America 1.7% (1.3 million), Southeast Asia 26.9% (48 million), Europe 1.2% (0.7 million). The research objective was to increase body weight on toddlers.

The method used in this research was case study. The samples of the research were 2 toddlers who indicated of malnourished at Banyumulek village, Kediri, West Lombok. This research was carried out by comparing 2 similar cases, namely "Midwifery Care for Toddlers with Malnutrition" case studies were carried out from 20 February to 15 May 2022.

The results of the research on undernourished toddlers in case 1 showed an increase in body weight of 8 ounces during the assessment and the patient was still malnourished, while in case 2 the increase in body weight was 3 ounces during the study, the patient was still malnourished.

The conclusion is that toddlers are still experiencing malnutrition, there is an increase in appetite and hygiene patterns and has carried out health education that has been given.
